                                                                                                                                                                                                                                                                                                                                                                                                        similarity to luciferase of PhotLinus pyralls, Luciola mingrelica, L. cruciata, L. lateralis, Hotaria parcula, Pyrophorus plagiophthalamus, Lampyris noctiluca, Pyrocoelia nayako or Photinus pennsylanvanica, where in the luciferase, an amino acid is different from a corresponding residue in wild-type and has increased thermostability. Also included are a nucleic acid which encodes the thermostable luciferase, a vector comprising the nucleic acid, a cell transformed with the vector, a plant comprising the cell, producing the thermostable luciferase and a kit comprising the thermostable luciferase. The thermostable luciferase is useful in any bioluminescent assay which utilises luciferase/luciferin reaction as signaling mode. The present sequence is a mutagenic PCR primer used to construct a DNA encoding a mutant luciferase from Photinus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           23-SEP-2004

The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, are methodism rejection or mechanical organ replacement rejection, in an individual. The method is also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lunus, inflammatory bowel diseases, multiple sclerosis, HIV/ALDS or viral, bacterial or fungal infection. The present sequence represents a primer for a 50 mer oligonucleotide marker for diagnosis and monitoring of allograft rejection and other disorders.
   knockout animals obtained by partially or completely inhibiting expression of the chondroitin/chondroitin sulphate synthase genes encoding the amino acid sequences of EQ ID No's 2, 4, 6, 66, 68, or 70, of 882, 775, 327, 884, 774 or 327 amino acids, respectively, or their homologues. The method can be used for detecting bone Paget's disease. The knockout animals can also be constructed for presenting the
                                                                                                                                                                                                           The present invention describes a method for detecting bone Paget's disease. The method comprises measuring the mutation or expression do of chondroitin/chondroitin sulphate synthase gene. Also described are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              detection; bone Paget's disease; Paget's disease;

                                   The invention relates to a novel method for identifying a subject at ri of breast cancer comprising detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The method of the invention has cytostatic applications and may be useful for identifying a subject at risk of breast cancer, for early diagnosis, prevention and treatment of breast cancer, possibly via gene therapy, as well as to analyse and predict a response to a breast cancer treatment and in clinical drug trials. The current sequence is that of an Extend primer (also described as probe) the invention which was used to genotype human Rho family guanine-nucleotide exchange factor KIAA0861 gDNA which has been mapped to
                                                                                                                                                                                                                                                    Identifying a subject at risk of breast cancer by detecting the presence of polymorphic variations in the ICAM, MAPK10, KIAA0861, NUMA1 or GALE regions which are associated with breast cancer in a nucleic acid sample
                                                                                                                                                                                                                                                                                                                                       Roth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 single nucleotide polymorphism;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RESULT 1913
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC 3' end does not contain seven or more bases that are perfectly matching CC except one mismatch to the 3' end sequence of the first primer or the Second primer, the first primer at its 3' end does not contain six or CC more bases that are perfectly matching to a sequence anywhere of the CC first primer or the second primer, and the first primer at its 3' end CC does not contain eleven or more bases that are perfectly matching except CC one mismatch to a sequence anywhere of the first primer or the second CC primer. The method is useful for designing primers for simultaneous CC amplification of target DNA fragments in a single multiplex polymerase CC chain reaction. It is also useful in the identification of multiple genes CC related to multifactorial diseases, the genome-scale detection of genetic CC eleted to multifactorial diseases, the genome-scale detection of genetic CC alterations, the studies in pharmacogenetic reactions, the genotyping CC genetic polymorphisms in a large population, the gene expression CC profiling in various samples and high throughput genotyping technologies. This sequence corresponds to an example of a primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

CC The methods and compositions of the present invention are useful for CC isolating and characterising archaeal or Pfu DNA polymerases with reduced CC base analogue detection activities. Mutations were introduced into the DNA polymerases that were likely to reduce uracil detection, while having composition is a mutagenic PCR primer used to create the mutants of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method of diagnosing or predicting susceptibility to Crohn's disease, comprising determining the presence or absence of a disease-prediaposing haplotype of a JM1 variant allele and/or 268S allele at the NOD2/CARD15 locus in an individual. The disease-predisposing haplotype further comprises a variant allele or an allele chosen from JM15, JM16, JM17 and JM18 variant allele. The disease-predisposing haplotype further comprises an allele at a single nucleotide polymorphism (SNP) chosen from SNP8, SNP12, and SNP13. The method is useful for diagnosing on predicting susceptibility to a variety of autoimmune diseases such as Crohn's disease, psoriasis, ulcerative colitis, mysathenia gravis, autoimmune gastritis and Type I diabetes. The present sequence represents a primer used to sequence the nucleotide sequence of NOD2/CARD15.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             comprises
haplotype
The invention relates to a method of designing primers for simultaneous amplification of target DNA fragments in a single multiplex polymerase chain reaction by aligning a first primer and a second primer. The metl comprises: (a) aligning a first primer and a second primer; and (b) selecting the first primer where the first primer at its 3' end does not be selected the first primer and the first primer at its 3'.
                                                                                                                                  Designing primers for simultaneous amplification of target DNA fragments in a single multiplex polymerase chain reaction, for high throughput multiplex DNA sequence amplification, comprises aligning two primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ss; primer; simultaneous amplification;

does not

The invention relates to a method of designing primers for simultaneous amplification of target DNA fragments in a single multiplex polymerase chain reaction by aligning a first primer and a second primer. The method comprises: (a) aligning a first primer and a second primer; and (b) selecting the first primer where the first primer at its 3' end does not contain four or more bases that are perfectly matching to the 3' end sequence of the first primer or a second primer, the first primer at its

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC contain four or more bases that are perfectly matching to the 3' end CC sequence of the first primer or a second primer, the first primer at its CC 3' end does not contain seven or more bases that are perfectly matching CC except one mismatch to the 3' end sequence of the first primer or the CC more bases that are perfectly matching to a sequence anywhere of the first primer or the second primer, and the first primer at its 3' end does not contain six or CC first primer or the second primer, and the first primer at its 3' end CC does not contain eleven or more bases that are perfectly matching except CC one mismatch to a sequence anywhere of the first primer or the second CC primer. The method is useful for designing primers for simultaneous CC amplification of target DNA fragments in a single multiplex polymerase CC chain reaction. It is also useful in the identification of multiple genes CC crelated to multifactorial diseases, the genome-scale detection of genetic CC alterations, the studies in pharmacogenetic reactions, the genotyping CC genetic polymorphisms in a large population, the gene expression CC profiling in various samples and high throughput genotyping technologies. This sequence corresponds to an example of a primer of the invention.

A genomic library of 0.5-1.5 kb fragments from the rose variety of 0.5-1.5 kb fragments from the rose variety of constructed in pUC18 and used to transform Escherichia coli and the cells tested against a high-density array of synthetic microsatellites. Inserts in plasmids that hybridised were sequenced and the identified sequences selected for ability to differentiate between a set of 30 rose varieties. The oligonucleotides are used for genetic analysis of cultivated and wild types of roses, particularly for genetic mapping and labelling of mono- or poly-genic traits, selection, analysis of relatedness, identification of varieties and evaluation of varietal purity, identification of hybrids and plant breeding. The
The invention relates to a novel non human knock-in (transgenic) animal carrying DNA with at least one manganese superoxide dismutase (MnSOD) exon flanked by two recombinase recognition sequences. The invention is useful for creating mouse models for use in researching ageing, including specific diseases such as Parkinson's disease and arteriosclerosis. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    purity, identification of hybrids and plant breeding. The oligonucleotides are useful in automated processes, do not require radioactive detection methods and can differentiate between almost all commercial rose varieties. The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbeta gene, VbetaRNA or cDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases including autoimmune diseases, degenerative nervous system diseases graft versus host disease, hypersensitivity diseases, infectious dit
                                                                                                                                                                                                                                    Disclosure;

This invention describes novel oligonucleotides derived from microsatellite markers and used for the amplification of the rose genome. The invention also describes a test kit for genetic analysis of cultured or wild forms of the genus Rosa sp. that contains at least one of the new oligonucleotide primers and preparing microsatellite markers of Rosa sp. by PCR amplification of hypervariable genomic regions, using at least one primer pair, to produce polymorphic fragments which are separated and detected. The primer pairs flank the microsatellite locus being amplified. The amplified markers are separated by electrophoresis, especially on high-resolution agarose or native or denatured polyacrylamide gels, or by mass spectrometry. After separation, the amplicons are detected by staining (ethicium bromide or silver),

New oligonucleotides from rose microsatellite markers, useful analysis, including identification of varieties and hybrids.

Degenerative nervous system diseases include multij sclerosis and Alzheimer's disease. Hyporsensitivity diseases include T I hypersensitivities such as contact with allergens that lead to allergies. Type II hypersensitivities such as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those manifested in leprosy. Infectious diseases include viral infections caused by viruses such as HIV, fungal infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases such as leukaemias, lymphomas and cancers such as cancer of the brain, breast. The present sequence represents a Vbeta PCR primer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a polynucleotide (I) relating to saccharide or lipid metabolism. (I) has antidiabetic, anorectic and hypolipaemic activities, and can be used in gene therapy. The polynucleotide (I) and its encoded polypeptide as well as its antibody are applicable in the diagnosis of and developing drugs for e.g. diabetes, obesity, hyperlipidaemia and hypercholesterolaemia, including by gene therapy. The polynucleotide (I) shows an elevated expression due to the administration of an insulin resistance-improving agent. The present sequence is used in the exemplification of the present invention.

The invention relates to a method of diagnosing cancer in an individual by measuring the genetic amplification, mRNA levels or protein levels of the elongation factor isoform EEFHA2 (also known as eEF-lalpha2) and comparing them with those from a normal control. An increase in EEFHA2 amplification or mRNA or protein levels relative to the control is indicative of the individual having cancer. The invention also relates to a method for prognosing survival and selecting an effective treatment regimen for a patient suffering from cancer; a kit for prognosing and/or diagnosing cancer; a method for inhibiting expression of EEFHA2 in a tumour cell using an EEFHA2 antisense oligonucleotide, especially a ribozyme; a method of treating cancer by administration of an inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to novel nucleic acid amplification primers for t detection of human cytokeratin (CK) 18, 19 or 20 expression by the LAMP (loop mediated isothermal amplification) method. The primers of the invention may be useful for the detecting cytokeratin 18-20 expression an indicator for the diagnosis of tumour metastasis, particularly prostate cancer and lymphoma. The amplification using the primers is highly efficient and allows very sensitive detection of tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; EEF1A2; eEF-lalpha2; EEF1A isoform; chromosome 20q13; genetic amplification; mRNA quantification; protein quantification; cancer; diagnosis; prognosis; drug screening; antisense therapy; gene therapy; ovarian cancer; breast cancer; colorectal cancer;
                                                                                                                                                                                                                                         Diagnosing cancer in a subject by comparing the measured EEF1A2 gene amplification, or EEF1A2 mRNA or protein levels or activity in a biological sample obtained from the subject with those in a control.
                                                                                                                                                                                                                                                                                                                                                                                                              07-JUN-2002; 2002US-0387231P

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            29-SEP-2001;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      present invention provides one new salt tolerance relative protein, obiotic Dufour algal enolase, and polynucleotides encoding the enolase recombinant technological process of producing the enolase. The sent invention also discloses the use of the polynucleotides encoding the nolase. The present invention also discloses the method of using the plates in improving plant's salt tolerance. The present sequence presents an RT-PCR primer used in the exemplification of the invention.

The invention also describes a kit, that comprises: (a) a delivery constructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antianflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a composition of the composition is useful for preventing or treating a respiratory, ling or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The composition allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory conditions pulmonary obstruction, pain, cystic fibrosis, allergic rhinitis, pulmonary transplantation, repection, pulmonary unponary of transplantation, pain, cystic fibrosis, allergic rhinitis, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thomal content of the anti-sense oligos corresponding to the target RNA serves to prevent the breakdown of the content of the anti-sense oligos corresponding to the target RNA serves to prevent the breakdown of the content of the anti-sense oligos corresponding to the target RNA serves to prevent the breakdown of the content of the anti-sense oligos corresponding to the target RNA serves to prevent the breakdown of the content of the anti-sense oligos corresponding to the target RNA serves to prevent the breakdown of the content of the anti-sense oligos corresponding to the breakdown of the content of the anti-sense oligos corresponding to the content of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              surfactant depletion or hyposecretion, when administered to a mammal. oligonucleotides are derived from a gene encoding or regulating oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA.

                                    The invention comprises the amino acid and coding sequences of novel human proteins (NOV proteins). The DNA and protein sequences of the invention are useful for the manufacture of a medicament for treating syndrome associated with a human disease comprising a pathology associated with the protein, such as: cancer or immune associated disorders. The present DNA sequence was used as a PCR primer for a NOV protein coding sequence in an example of the invention.

A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of biquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction,

CC nucleotide is complementary to the nucleotide at the variant site and the Cf first and second fluorophore borne by the extension product are brought into an energy transfer relationship while the primer is hybridised to CC the target nucleic acid, where the first and second fluorophore comprise a donor and an acceptor fluorophore which have a donor-acceptor spacing in the extension product of less than 18 nucleotides, the donor CC fluorophore having a high extinction coefficient and a low fluorescence CC quantum yield, and detecting the presence or absence of the double-CC labelled extension product, the presence or absence of the double-CC labelled extension product, the presence or absence of the double-CC labelled extension product indicating the identity of the nucleotide at the variant site. The methods are useful for a variety of applications consider the variant site. The methods are useful for other applications in which specific sequence information is of value, including detection of cpathogens, paternity disputes, prenatal testing and forensic analysis, CC pathogens, paternity disputes, prenatal testing and forensic analysis, CC pathogens, paternity disputes, prenatal testing and forensic analysis, CC pathogens, paternity disputes, prenatal testing and forensic analysis, CC pathogens, paternity disputes, prenatal testing and forensic analysis, CC pathogens, paternity disputes, prenatal testing and forensic analysis, CC pathogens, paternity disputes, prenatal testing and forensic analysis, CC pathogens, paternity disputes, prenatal testing and forensic analysis, CC pathogens, paternity disputes, prenatal testing and forensic analysis, CC pathogens, paternity disputes, prenatal testing and forensic analysis, CC pathogens, paternity disputes, prenatal testing and forensic analysis, CC pathogens, paternity disputes, prenatal testing and forensic analysis, CC pathogens, paternity disputes, prenatal testing and forensic analysis, of creations in the actual risk of an individual known to be compatible.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RESULT 1895
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

CC in the extension product of less than 18 mucleotides, the donor control of fluorophore having a high extinction coefficient and a low fluorescence CC quantum yield, and detecting the presence or absence of the double-CC labelled extension product, the presence or absence of the double-CC labelled extension product indicating the identity of the nucleotide at the variant site. The methods are useful for a variety of applications CC such as analysing point mutations and single nucleotide polymorphisms CC (SNPs). The methods are also useful for other applications in which CC specific sequence information is of value, including detection of CC pathogens, paternity disputes, prenatal testing and forensic analysis, CC for developing correlations between certain genotypes and patient CC prognosis, for formulating optimal treatment protocols for a particular CC disease, for assessing the actual risk of an individual known to be susceptible of acquiring a disease and for identifying point mutations in CC resistance to certain therapeutics. The methods are further useful for CC identifying carriers of mutant alleles, for tissue classification or in CC primer used in the method of the invention. dependent extension of the primer in the presence of a polymerase and non extendible nucleotide and detecting the presence of a besonce of the double-labelled extension product indicating the identity of the nucleotide at the variant site. The invention also relates to a method for determining the identity of a nucleotide at a variant site of a target nucleic acid, involving hybridising a primer bearing a first fluorophore to a segment of the primer hybridises to the target nucleic acid, involving hybridises to the target nucleic acid to form a labelled hybrid, where the 3'-end of the primer hybridises to the target nucleic acid immediately adjacent to the variant site, conducting template-cell dependent extension of the primer in the presence of a polymerase and at least one non-extendible nucleotide bearing a second fluorophore, where a double-labelled extension product is formed if the non-extendible nucleotide is complementary to the nucleotide at the variant site and the first and second fluorophore borne by the extension product are brought into an energy transfer relationship while the primer is hybridised to the target nucleic acid, where the first and second fluorophore comprise a donor and an acceptor fluorophore which have a donor-acceptor spacing in the extension product of less than 18 nucleotides the donor of the donor spacing in the extension product of the second fluorophore comprise a donor and an acceptor fluorophore which have a donor-acceptor spacing The invention relates to a method of analysing a variant site of a target nucleic acid, involving hybridising a primer bearing a fluorophore to the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SS
                                             The invention relates to a method of analysing a variant site of a target CC nucleic acid, involving hybridising a primer bearing a fluorophore to the carget nucleic acid, to form a labelled hybrid, conducting template-CC dependent extension of the primer in the presence of a polymerase and non cextendible nucleotide and detecting the presence or absence of the CC double-labelled extension product indicating the identity of the CC nucleotide at the variant site. The invention also relates to a method for determining the identity of a nucleotide at a variant site of a target nucleic acid, involving hybridising a primer bearing a first CC fluorophore to a segment of the target nucleic acid to form a labelled cc acid immediately adjacent to the variant site, conducting template-CC dependent extension of the primer hybridises to the target nucleic dependent extension for the variant site, conducting template-CC double-labelled extension product is formed if the non-extendible nucleotide bearing a second fluorophore, where a double-labelled extension product is formed if the non-extendible nucleotide is complementary to the nucleotide at the variant site and the first and second fluorophore borne by the extension product are brought into an energy transfer relationship while the primer is hybridised to the target nucleic acid, where the first and second fluorophore comprise a donor and an acceptor fluorophore which have a donor-acceptor spacing in the extension product of less than 18 nucleotides, the donor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                            (SNPB). The methods are also useful for other applications in which specific sequence information is of value, including detection of pathogens, paternity disputes, prenatal testing and forensic analysis, for developing correlations between certain genotypes and patient prognosis, for formulating optimal treatment protocols for a particular disease, for assessing the actual risk of an individual known to be susceptible of acquiring a disease and for identifying point mutations i microorganisms that could potentially result in altered pathogenicity or resistance to certain therapeutics. The methods are further useful for identifying carriers of mutant alleles, for tissue classification or in blood typing. This sequence represents a cyanine (CYA) dye-labelled primer used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                            labelled extension product indicating the identity of the nucleotide the variant site. The methods are useful for a variety of application such as analysing point mutations and single nucleotide polymorphisms

Analyzing variant site of target nucleic acid, involves hybridizing primer to target nucleic acid, conducting template-dependent extens primer, detecting presence or absence of double-labeled extension extension of.

Disclosure; Fig 3C; 24pp; English

The invention relates to a method of analysing a variant site of a t nucleic acid, involving hybridising a primer bearing a fluorophore t target nucleic acid to form a labelled hybrid, conducting template-dependent extension of the primer in the presence of a polymerase are extendible nucleotide and detecting the presence or absence of the double-labelled extension product indicating the identity of the nucleotide at the variant site. The invention also relates to a methor determining the identity of a nucleotide at a variant site of a and target non

This invention relates to a novel isolated DNA sequence and the proteins encoded by them. The sequences disclosed may be useful during the development of compounds with a neuroprotective, ophthalmological, cytostatic, cardiant or antiarrhythmic activity. In addition the sequences may be useful for gene therapy. Specifically claimed is an isolated DNA comprising any of the 11 fully defined sequences of 1006-7062 bp given in the specification. The polymucleotide encodes a polypeptide comprising any of the 11 fully defined sequences of 89-1707 amino acids given in the specification. The DNA and protein are useful as molecular markers, as drug targets, and for detecting, diagnosing, staging, monitoring, prognosticating, preventing, treating or determining
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           neuroprotective; ophthalmological; cytostatic; cardiant; antiarrhythmic; gene therapy; molecular marker; drug target; detecting; diagnosing; stagging; monitoring; prognosticating; preventing; treating; disease predisposition; abnormal gene expression; human; neurological disorder; visual disorder; myopathy; heart failure;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 22
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            some bacterial and protozoa infections. Recombinant heparanase can also be used to neutralise plasma heparin, as a potential replacement of protamine. Sequences of the invention are used in protein therapy. The present sequence is human heparanase DNA amplifying PCR primer used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                24-MAY-2002; 2002US-0382614P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          នន្ទំនួននង្គង
                       The invention relates to human keratinocyte derived interferon (KDI; ADF94966) and nucleic acids encoding it (ADF94965). The KDI gene is clocated on chromosome 9g22. The invention also relates to sequences at the test of the kDI nucleic acid and protein sequences; a colypeptide comprising an epitope-bearing portion of KDI; recombinant vectors and host cells comprising a KDI nucleic acid sequence; a method for the recombinant expression of KDI proteins; a KDI-specific antibody; KDI agonists and antagonists; use of KDI nucleic acids or proteins for treating medical conditions; a method for the diagnosis of a pathological condition or susceptibility to a pathological condition; and methods of creening for KDI binding partners. The KDI polypeptides and condition, and methods of treating or ameliorating a medical condition, such as an immune-related disorder, cancer, or a viral infection or viral exposure. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        abnormal expression of a gene in a subject (for example neurological or visual disorders, myopathy, heart failure, arrhythmias or cancer). These may also be used in research, drug discovery, clinical medicine or forensic science. The present sequence is that of an oligonucleotide probe which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human keratinocyte derived interferon; human KDI; agonist; antagonist; inding partner identification; immune-related disorder; cancer; viral infection; viral exposure; immunomodulator; virucide; cytostatic;

A polypeptide of the invention has antiinflammatory, dermatological, immunosuppressive, and antimicrobial activity, and may have a use in a vaccine. The polypeptide is useful for treating inflammatory diseases, such as inflammatory bowel disease, ulcerative colitis, Crohn's disease, atopic dermatitis, eczema, psoriasis, endotoxaemia, septicaemia, toxic shock syndrome or infectious diseases. The present sequence is used in

The method of the invention is useful for manufacturing a target substance such as L-amino acid preferably L-glutamic acid. The method enables manufacture of L-glutamic acid at high temperatures and reduces the viscosity of culture medium. The present sequence is used in the exemplification of the

The present invention relates to novel jungle red fowl heparanase protein and polynucleotides encoding such proteins. Heparanase sequences can be used to develop treatments for various diseases, to develop diagnostic assays for these diseases and to provide new tools for basic and directed research especially in the fields of medicine and biology. They can be used to develop new drugs to inhibit tumour cell metastasis, inflammation and autoimmunity. Recombinant heparanase offers a potential treatment for wound healing, angiogenesis, restenosis, atherosclerosis, inflammation, Recombinant jungle red fowl (Gallus gallus) heparanase protein, useful for treating cancers, microbial infections and aiding wound healing.                                                                                                                                                     The present invention relates to a method (M) for detecting chromosome translocation. The method comprises amplifying a target nucleic acid sequence from a sample, hybridizing oligonucleotides (ONTS) specific for regions of the translocation to the amplified target, where the ONTs comprise capture tags, extending the ONTs to produce labelled extended ONTs, hybridizing the ONTs to address tags on solid support and detecting the presence of labelled extended ONTs on the solid support and detecting useful for detecting a chromosomal translocation in a target nucleic acid sequence, preferably a cDNA from a biological sample from a human: The chromosome translocation is associated with cancer (e.g. leukaemia) and this method is especially useful for diagnosing cancer, especially
                                                                                                                                                                                                                                                                                                                                               microsphere arrays.
                                                                                                                                                                                                                                                                                                                                                          Detecting chromosome translocations in a target nucleic acid sequence for diagnosing cancers associated with chromosome translocations, by using
                                                                                                                                                                                                                                                                                                                                                                                                   WPI; 2003-468806/44.

                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 22 BP; 10 A; 2 C; 9 G; 1 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel set of inter-simple sequence repeats (ISSR)-PCR primers for genotyping eukaryotes. The primers of the invention may be useful for genotyping diverse genomes of plant and animal systems, in particular for distinguishing Basmati rice varieties from non-Basmati rice varieties and traditional Basmati rice varieties from evolved Basmati rice varieties. The current sequence is that of the

                                                                                                                                                                   The present invention relates to a method for determining a functional allele profile of a gene in a population. The method comprises identifying the nucleotide sequence of a gene of interest out of genomic DNA from each of a population of individuals identified as having a family history which indicates inheritance of functional alleles of the gene of interest, and rank ordering the frequency of occurrence of each haplotype, where the identity of the alleles containing each haplotype and the determination of their relative frequencies constitutes the functional allele profile of the gene of interest in the population. The method is useful for determining functional allele profiles which are useful in the treatment and diagnosis of diseases, for genetic and pharmacogenetic applications, and for evaluating the degree to which the profile of the gene of interest in the profile which are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  04-AUG-1997;

A
CC substrate, in which before transfer the tip is modified to allow the concleic acid to wet the tip and the nucleic acid is modified to chemisorb co or covalently bond to the substrate upon transfer. The method is also consequently bond to the substrate upon transfer. The method is also consequently bend to the substrate upon transfer. The method is also consequently a scanning of modified nucleic acid onto a substrate, by inking a scanning probe microscopic tip with a modified nucleic acid contained the substrate to form a nanoscale consequently in the nucleic acid to the substrate to form a nanoscale consequently a first nucleic acid onto a substrate to form a proposition from a consequently a first nucleic acid onto a substrate to form a deposit with lateral nanoscale features of 1000 mm or less by direct write consoparticle, where the nanoparticle is functionalized with a second nucleic acid which is either complementary to the first or complementary to the substrate is considered to form a nanoarray of the nucleic acid and the hybridization is carried out with the nanoarray of the nucleic acid and the hybridization is corrected to form a nanoarray of the nucleic acid and the hybridization is consistent and descructive methods. The structures can be built up, if desired, without degrading existing structures can be built up, if desired, not needed. Improvements in the consistency and stability of the consolithography can be observed. This sequence represents an example of a nucleic acid in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            nanoscopic tip relative to a substrate so that the tip and substrate approach each other, and the nucleic acid is transferred from the tip to the substrate to generate a stable nucleic acid nanoscale pattern on the substrate which is hybridizable with complementary nucleic acid. The substrate which is hybridizable with complementary nucleic acid. The method is useful for generating nanoscale patterns of nucleic acid on a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a method of depositing nucleic acid substrate by direct-write nanolithography, by positioning at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Depositing nucleic acid on substrate by direct-write nanolithography, positioning nanoscopic tip relative to substrate, to transfer nucleic acid to substrate and generate stable nucleic acid nanoscale pattern.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Disclosure; Page 38;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 30-NOV-2001;

                      The specification describes a method of modifying the expression of at a toll-like receptor (TLR) in cells of the human central nervous system (CNS). The method comprises contacting the cells with a TLR-expression modifying agent, selected from substances that are endogenous to the human CNS and its parts or variants, that is capable of altering the expression of a TLR in the cells. The TLR-expression modifying agent is useful for preparing a pharmaceutical composition for retarding or inhibiting a neurodegenerative process and/or stimulating a neurodegenerative process and/or stimulating a neurodegenerative disease, multiple sclerosis or stroke. The present PCR primer was used to amplify cDNA encoding human TLR5. The primer was used to determine the amount of TLR present in human glia cells in a semi-quantitative RT-PCR
                                                                                                                                                                                                                                                                           e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Toll-like receptor; TLR; central nervous system; CNS; neurodegenerative disorder; Alzheimer's disease; Parkinson's Pick's disease; multiple sclerosis; stroke; PCR; primer; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ACC43827 standard;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match
                                                                                                                                                                                           Collagen a specified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            single chain transmembrane proteins. The hormones prolactin (PRL) and growth hormone (GH) exert their effects by inducing the homodimerisation of their respective receptors, initiating the activation of receptor-associated kinases and signalling cascades. The human PRLBP (hPRLBP) was identified in human serum and is homologous to the extracellular domain (ECD) of PRLR. A recombinant hPRLBP has been shown to inhibit PRL-induced cellular proliferation of Nb2 (not defined). The PRLBP, or composition containing it, is useful for inhibiting Nb2 cells, for diagnosing disease or conditions associated with somatolactogenic function, for raising an anti-PRLBP antibody, for treating breast and prostate cancer and for treating conditions associated with sevens prolactin and growth hormone, such as pituitary adenomas, which can lead to hyperprolactinaemia or gigantism/acromegaly. The sequence presented is the PCR primer, PRLR-1, which was used to amplify the recombinant human PRLBP
The present invention relates to the isolation of DNA-binding protein Y I which acts as a collagen accumulation inhibitor. The invention also provides a method for collagen accumulation inhibition, and a method for searching for a substance which regulates the type-I collagen gene transcription regulating ability. The DNA binding protein YB-1 and the polynucleotide sequence encoding it are useful in compositions for inhibiting collagen accumulation, inhibiting transcription of a type-I collagen gene and inhibiting diseases caused by excessive accumulation
                                                                                                                                                         Example

```

The present invention relates to the isolation of human keratinocyte derived interferon (KDI) protein, and the polynuclectide sequences encoding it. The gene encoding thuman KDI maps to chromosome 9. The novel KDI protein is a member of the interferon family. The invention also describes vectors, host cells, and recombinant methods for producing the KDI protein. The invention also discloses methods for identifying agonists and antagonists of KDI activity. An antibody that binds to the KDI protein, the KDI polypeptide sequence, and the polynucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                 RESULT 1878
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     rine invention relates to human and mouse alpha-catenin polypeptides and their associated polynucleotides. The polypeptides and related antibodies are useful for modulating the cadherin-catenin related pathway in selected organs, such as the heart and testis. The nucleic acids and the likelihood of developing cadherin-catenin related diseases. The nucleic acids may also be used to predict the likelihood of developing cancer or in diagnosing cancer, and in gene therapy. The polypeptide, the nucleic acids may also be used to predict the likelihood of developing cancer or in diagnosing cancer, and in gene therapy. The polypeptide, the nucleic acid or the antibody is useful in manufacturing a medicament for treating cadherin-catenin related diseases, such as cancer, cardiomyopathy, specifically dilated cardiomyopathy, and male infertility. Sequences ABK41510-ABK41599 represent PCR primers used to amplify DNA encoding human and mouse alpha-catenin polypeptides, including the CTNNA3 gene which encodes human alpha T-catenin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 22 BP; 2 A; 9 C; 2 G; 9 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New alpha catenin polypeptides and polynucleotides encoding them, useful for predicting, diagnosing or treating cadherin-catenin related diseases, particularly cardiomyopathies, cancer and male infertility.

The encoded polypeptides can be used to prevent tumour angiogenesis, metastasis and invasion, and to intervene with pathologies associated with impaired heparin-binding growth factors, cellular responses to heparin-binding growth factors, cell interaction with plasma lipoproteins, cellular susceptibility to viral, protozoa and bacterial infections or disintegration of neurodegenerative plaques. The present sequence represents a human heparanase (hpa) cDNA fragment amplifying PCR primer. This is used for generating a chimeric chicken-human heparanase gene

စ

New alpha catenin polypeptides and polynucleotides encoding them, useful for predicting, diagnosing or treating cadherin-catenin related diseases, particularly cardiomyopathies, cancer and male infertility.

Example; Page 35; 132pp; English.

The invention relates to human and mouse alpha-catenin polypeptides and their associated polynucleotides. The polypeptides and related antibodies are useful for modularing the cadherin-catenin related pathway in selected organs, such as the heart and testis. The nucleic acids and the antibodies are useful in the diagnosis and/or prediction of the likelihood of developing cadherin-catenin related diseases. The nucleic acids may also be used to predict the likelihood of developing cancer or in diagnosing cancer, and in gene therapy. The polypeptide, the nucleic acid or the antibody is useful in manufacturing a medicament for treating cadherin-catenin related diseases, such as cancer, cardiomyopathy, and male inferrility. Sequences abk41510-ABK41599 represent PCR primers used to amplify DNA encoding human and mouse alpha-catenin polypeptides, including the CTNNA3 gene which encodes human alpha T-catenin

Polynucleotides comprising one or more of twenty four novel single nucleotide polymorphisms in the TNFRSF11B gene have been identified. TNFRSF11B regulate osteoclast recruitment and function. An understanding of variations in the gene should thus be useful in developing new therapies for metabolic disorders caused by abnormal osteoclast recruitment and function such as osteoporosis, metastatic bone disease,
   oligonucleotides of the SNP flanking sequence, the oligonucleotides are
                                                             Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNPE) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAH39817;

invention

The present invention relates to coding sequences for human g chromosome 9q31-34 (ABN99375-ABN93455). The genes are likely involved in diseases of plasmatic lipoprotein metabolism, e.g reverse transport of cholesterol. The present sequence is a P

for diagnosis ers of

```
CC performing a single-nucleotide primer extension reaction. The coligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for e.g. to CC assess by association analysis the genotype of an individual or group of CC caused by one or more SNPs. Phenotypic traits include diseases e.g. CC agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular CC dystrophy, familial hypercholesterolaemia, polycystic kidney disease, costeogenesis imperfects and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial CC disease of which a component is or may be genetic such as autoimmune CC diseases, including, rheumatoid arthritis, multiple sclerosis, CC inflammation, cancer, nervous system diseases and infection by pathogenic CC microorganism. The method is also useful in forensic investigations and CC paternity analysis. The present sequence represents a PCR primer specific for a human SNP containing DNA sequence

                                                                                                                                                                                                     AAF72366 standard;
                                                                                                                                                                                                                                                                                                                        Sequence
                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel mammalian protein, designated A-C1, and the polynucleotide encoding it. The protein inhibits the growth of cells transformed by H-ras, and so inhibits the development of cancer. The A-C: gene is expressed specifically in chondrogenic cells. The present sequence is a primer used in an example illustrating the invention

```
This invention relates to human polynucleotide sequence AAF7233 which CC encodes keratinocyte derived interferon (KDI) protein AAB49774, which is CC a member of the interferon family. AAF7238 represents the codon CC optimised sequence of KDI. The human KDI gene is located on chromosome 9. CC The specification includes KDI related protein sequences AAB4975 - CC AAB49789, Also given in the specification are primer, probe and CC polynucleotide sequences represented by AAF72330 (excluding CC polynucleotide sequences represented by AAF72334 AAF72370 (excluding CC sequence of the invention. The KDI polypeptide is used to treat viral CC sequence of the protein and polynucleotide may be used to prevent, treat or ameliorate a medical condition such as immune system-related CC disorder, viral infection, viral exposure and cancer in a mammal. CC Specific disorders which can be treated by KDI include multiple CC sclerosis, lymphoma, acquired immune deficiency syndrome, viral CC hepatitis, Cryptosporidium parvum infection, chronic myelogenous cCC leukaemia, arthritis, diabetes and allergies

       CC Oligonucleotides AAZ45137-Z45140 specifically hybridise under stringent conditions to one of the matrix metalloproteinase-9 MMP-9 polymorphisms. CC MMP-9 is a zinc-dependent endopeptidase, and is located on chromosome 20. CC MMP activity is associated with inflammatory diseases and MMP-9 is critically is associated with inflammatory diseases and MMP-9 is cc implicated in the pathology of multiple sclerosis. Certain polymorphic CC sequences in the MMP-9 promoter, coding sequence and 3' untranslated cregion of the human MMP-9 gene (see AAZ45145) can affect the severity of atherosclerosis. The invention relates to the presence or absence of one CC variant form of a MMP-9 gene polymorphism (-1562 Cytosine/Threonine). CC detection of this polymorphism can be used for disease prognosis. The CC methods and oligonucleotides are used to detect polymorphisms in the MMP-0 gene. They are useful for the diagnosis and prognosis of diseases CC characterized by metalloproteinase mediated remodelling, such as CC atherosclerosis, tumour invasion and metastasis, inflammatory disease, CC and neurological diseases, particularly those involving demyelination CC such as multiple sclerosis, and arthritic disease. Proteins encoded by CC and neurological diseases, particularly those involving that bind CC sequence, thus identifying compounds which modulate the activity of the CC enzyme. Such occompounds can then be used for variant of a polymorphic CC servme. Such compounds can then be used for variant of a polymorphic CC enzyme. Such compounds can then be used for variant of a polymorphic CC servme. Such compounds can then be used for variant of a polymorphic CC servme. Such compounds can then be used for variant of a polymorphic CC servme. Such compounds which modulate the activity of the convenience of the compounds which modulate the activity of the convenience of the compounds which modulate the activity of the convenience of the compounds which modulate the activity of the convenience of the compounds which modulate the activit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RESULT 1868
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                            The present invention describes a radiation hybrid map of the dog (Canine familiaris) genome comprising the genome location of a marker selected from AAA6613 to AAA66942. The radiation hybrid map is useful for identifying and localising dog genes, since it covers approximately 80 % of the dog genome and provides a dense map integrating different types (i.e. Type I and Type II) of markers. The map and the dog genome markers responsible for phenotypic and behavioural traits in dogs, to identify morbid genes, to analyse diseases and identify implicated genes in such diseases and their alleles, and to study dog pedigrees. They may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 22 BP; 6 A; 5 C; 5

                      The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with lung/respiratory disorders and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             9849/c

                                                                                                                                                                                                                                                                                                                                                                                                   Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Low adenosine antisense oligonucleotide; phosphorothioate; allergy; human; airway disorder; bronchoconstriction; lung inflammation; surfactant depletion; respiratory; bronchodilator; antiinflammatory; immunosuppressive; antiasthmatic; analgesic; hypotensive; cytostatic; respiratory obstruction; pulmonary obstruction; impeded respiration; surfactant hypoproduction; pulmonary vasoconstriction; asthma; RDS; respiratory distress syndrome; pain; cystic fibrosis; allergic rhinitis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             enzymes comprising specific mutation which increase its thermostability. Also included in the invention are: 1) a vector comprising a nucleotide sequence encoding the mutant luciferase; 2) a cell transformed with the vector and, 3) a plant comprising the transformed cells; The luciferase enzyme is useful in bioluminescent assays, where it uses the substrate D-luciferin (4,5-dihydro-2-(6-hydroxy-2-benzothiazolyl)-4-thiazole
                                                                                                                                                                                                                                                                                                                                       Claim 14; Page 251; 1592pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WPI; 2000-679539/66.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                06-APR-1999;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 pulmonary hypertension; emphysema; pulmonary transplantation rejection;
chronic obstructive pulmonary disease; pulmonary infection; bronchitis;
